

Sessions 1:-

Q5. Compare your procedural C version and OOP TaskList version: List 3 problems you faced in the C version that were solved by using classes and methods in the OOP version.

Three Problems in the C Version Solved by OOP

1. **No Data Protection**
 - **Problem in C:** Task data could be modified directly from anywhere in the program.
 - **Solution in OOP:** Classes use **encapsulation**, keeping data private and allowing changes only through methods.
2. **Poor Code Organization**
 - **Problem in C:** Functions and variables were scattered throughout the program, making it harder to understand and maintain.
 - **Solution in OOP:** The `TaskList` class groups related data and methods together, making the code more organized.
3. **Difficult to Extend**
 - **Problem in C:** Adding features like deleting, updating, or marking tasks as completed required modifying multiple functions.
 - **Solution in OOP:** New functionality can be added by creating new methods or extending classes, making the program easier to maintain and scale.
